Conditional Statements (If, elif, else)

Loops (For loop, While loop)

Strings, Dictionaries and Lists

Miscellaneous projects

Conditional Statements

#1 Program to sort odd and even elements in a list into two different lists

SOURCE CODE ↓

```
try:
    a=eval(input("\nEnter List: "))
    aeven=[]
    aodd=[]
    for i in range(len(a)):
        if a[i]%2==0:
            aeven.append(a[i])
        else:
            aodd.append(a[i])
    print("\nEven numbers in list are:",aeven)
    print("Odd numbers in list are :",aodd)
except BaseException as e:
    print('An exception occurred:',e)
```

OUTPUT ↓

```
Enter List: [3,6,64,393,-79]

Even numbers in list are: [6, 64]
Odd numbers in list are : [3, 393, -79]
PS M:\py>
```

#2 Program to find the largest number among three user-inputted numbers

SOURCE CODE ↓

```
a=float(input("\nEnter first number : "))
b=float(input("Enter second number: "))
c=float(input("Enter third number : "))

if(a>b and a>c):
    print("\nFirst number entered ("+str(a)+") is the largest")

elif(b>a and b>c):
    print("\nSecond number entered ("+str(b)+") is the largest")

else:
    print("\nThird number entered ("+str(c)+") is the largest")
```

OUTPUT ↓

```
Enter first number : 26.75
Enter second number: -78
Enter third number : 343

Third number entered (343.0) is the largest
PS M:\py>
```

#3 Program to accept any amount of numbers from a user, store them in a list and then show the frequency of elements between 50 and 80

SOURCE CODE ↓

```
1   lst_5080=[]
2   print('Type "done" to break out of loop')
3   while True:
4       try:
5           a = input('Enter a number: ')
6           if a.lower()=='done': break
7           if 50<int(a)<81: lst_5080.append(int(a))
8       except ValueError:
9           print('Not a number! Try again')
10          continue
11  if bool(lst_5080):
12      print("Elements in list in range 50 to 80 are:")
13      for i in set(lst_5080):
14          print(i,": occurs",lst_5080.count(i),"times")
15  else:
16      print("No elements in range 50-80")
```

OUTPUT ↓

```
Type "done" to break out of loop
Enter a number: 23
Enter a number: 79
Enter a number: abc
Not a number! Try again
Enter a number: 52
Enter a number: 81
Enter a number: 79
Enter a number: done
Elements in list in range 50 to 80 are:
52 : occurs 1 times
79 : occurs 2 times
PS M:\py>
```

#4 Program to enter the bill amount, ask the user for the method of payment and calculate discount

SOURCE CODE ↓

```
bill=float(input("\nEnter bill amount: "))
mode=int(input("1. Credit Card\n2. Debit Card\n3. Net Banking\n4. Other\nEnter mode of payment: "))

if(mode==1):
    disper=(10/100)
    amt=bill-(bill*disper)

elif(mode==2):
    disper=(5/100)
    amt=bill-(bill*disper)

elif(mode==3):
    disper=(2/100)
    amt=bill-(bill*disper)

elif(mode==4):
    disper=(0/100)
    amt=bill-(bill*disper)

else: print("Bad choice")
print("Net payable amount is ₹",amt,"\nAmount deducted is ₹",(bill*disper))
```

OUTPUT ↓

```
Enter bill amount: 50
1. Credit Card
2. Debit Card
3. Net Banking
4. Other
Enter mode of payment: 1
Net payable amount is ₹ 45.0
Amount deducted is ₹ 5.0
```

```
Enter bill amount: 50
1. Credit Card
2. Debit Card
3. Net Banking
4. Other
Enter mode of payment: 2
Net payable amount is ₹ 47.5
Amount deducted is ₹ 2.5
```

```
Enter bill amount: 50
1. Credit Card
2. Debit Card
3. Net Banking
4. Other
Enter mode of payment: 3
Net payable amount is ₹ 49.0
Amount deducted is ₹ 1.0
```

```
Enter bill amount: 50
1. Credit Card
2. Debit Card
3. Net Banking
4. Other
Enter mode of payment: 4
Net payable amount is ₹ 50.0
Amount deducted is ₹ 0.0
```

#5 Program to determine number of alphabets (uppercase and lowercase), digits, whitespaces, words and special characters in given piece of text

SOURCE CODE ↓

```
txt = input('\nEnter text: ')
alpha, num, w_space, special_char, lowerc, upperc = 0,0,0,0,0,0
for i in txt:
    if i.isalpha():
        alpha+=1
        if i.islower():
            lowerc+=1
        else:
            upperc+=1
    elif i.isdigit():
        num+=1
    elif i == ' ':
        w_space+=1
    else:
        special_char+=1
print('',alpha,'alphabets\n',lowerc,'lowercase characters')
print('',upperc,'uppercase characters\n',num,'digits')
print('',w_space,'whitespaces\n',w_space+1,'words')
print('',special_char,'special characters')
```

OUTPUT ↓

```
Enter text: **L0rem 1p$um dOloR s!t aM€t**
 17 alphabets
 13 lowercase characters
 4 uppercase characters
 2 digits
 4 whitespaces
 5 words
 7 special characters
PS M:\py>
```

#6 Simple arithmetic calculator

SOURCE CODE ↓

```
from time import sleep
print('Calculator'.center(24,'*'))
while True:
    n,lst_num = int(input('Enter number of numbers to enter: ')),[]
    if n==1:

Tick 9
Tick 8
Tick 7
Tick 6

Encountered 5, Exiting loop....
```

#8 Program to print comma separated numbers from given start value to stop value with some step value (all user given) using while loop

SOURCE CODE ↓

```
start = int(input('\nEnter starting number: '))
end   = int(input('Enter ending number  : '))
step  = int(input('Enter step value     : '))

while start<=end:
    print(start,end=('' if start+step > end else ', '))
    start += step
```

OUTPUT ↓

```
Enter starting number: 5
Enter ending number  : 100
Enter step value     : 5
5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 100
```

```
Enter starting number: 4
Enter ending number  : 107
Enter step value     : 7
4, 11, 18, 25, 32, 39, 46, 53, 60, 67, 74, 81, 88, 95, 102
```

#9 Program to print and find sum of user-inputted numbers using a for loop

SOURCE CODE ↓

```
a=int(input("Enter start of range: "))
b=int(input("Enter end of range: "))

add = 0
c=1 if a<b else -1

print("\nNumbers are:")
for i in range(a,(b+c),c):
    print(i,end=(', ' if i!=b else ''))
    add += i

print("\nSum is:",add)
```

OUTPUT ↓

```
Enter start of range: 7
Enter end of range: 2

Numbers are:
7, 6, 5, 4, 3, 2
Sum is: 27
PS M:\py>
```

#10 Linear search program that calculates the frequency of a particular element in a list and displayes that along with the element indices

SOURCE CODE ↓

```
lst=eval(input("\nEnter list: "))
while True:
    a=input("\nEnter element to search (enter 'end' to end program): ")
    if a=='end':
        print('Exiting program...')

OUTPUT ↓

```
List editor, created in Python 3.7.7 by Meghraj Goswami, Class XI-A
To enter a list, type comma separated values bw square brackets []
Index values start from 0, so position of first element in list has index number 0

Enter list: [1,3,5,6,8]

Choose ->
1. Add element to list
2. Replace element in list
3. Remove element from list
4. Sort list
5. Count elements in list
6. Remove modifications/revert to original list
7. Clear list
8. Display lists
9. Other info
10. End program
Your choice:
```

#24 Program to convert english text into Leetspeak and Leetspeak into English (Code Bowling)

Leetspeak is an informal language or code used on the internet, in which standard letters are often replaced by numerals or special characters that resemble the letters in appearance

This project was my submission in a Code Bowling event (most creative code possible)

The code is shaped in the letters ‘L337’ (LEET) and has exactly 1337 characters (including comments)

SOURCE CODE ↓

```
'''

Enter your name: meghraj goswami
What would you like to call me: computron

Hello, Meghraj
I am Computron, nice to meet you!
Talk away!

>> heyy!
Sup!

>> how are you today??
Everthing's fully functional!

>> can you tell me my name?
Your name is Meghraj Goswami
There are 14 characters in your name
An interesting anagram of your name is Ieag Ghjaomwsm

>> what about your name?
My name is Computron
There are 9 characters in my name
An interesting anagram of my name is Trpooumcn

>> that's cool!
Okay!

>> tell me a pun
What do you call a lost wolf?
A where-wolf

>> nice
Nice!

>> thanks for your time, computron!
Happy to help!

>> goodbye then
Seeya!
```

#29 Discord bot to give links to anime videos on 9anime as required by the user
